Blazor: Getting Started

BUILDING YOUR FIRST BLAZOR APPLICATION

Gill Cleeren CTO XPIRIT BELGIUM @gillcleeren www.snowball.be

Overview

What will you learn from this course?

Hello Blazor

The different besting models of Blaze

The different hosting models of Blazor

Understanding File → New Project

Creating a first Blazor app

Debugging a Blazor app

What Will You Learn from This Course?

This course will teach you how to build your first Blazor application.

How We Will Approach This Course

Quite some code...

And then, a full Blazor application!

What I Assume You Know

HTML and CSS

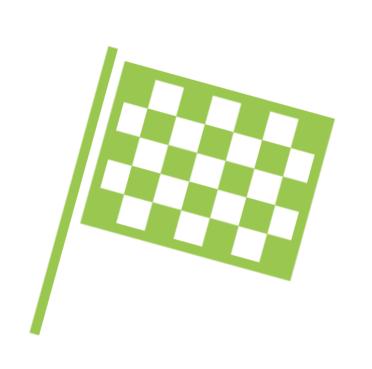

C#

Some Razor is recommended

What You Need to Have Installed

Visual Studio 2019

https://visualstudio.microsoft.com/vs/

.NET Core 3.0 SDK

 https://dotnet.microsoft.com/download/ dotnet-core/3.0

A browser

The Scenario: Bethany's Pie Shop HRM

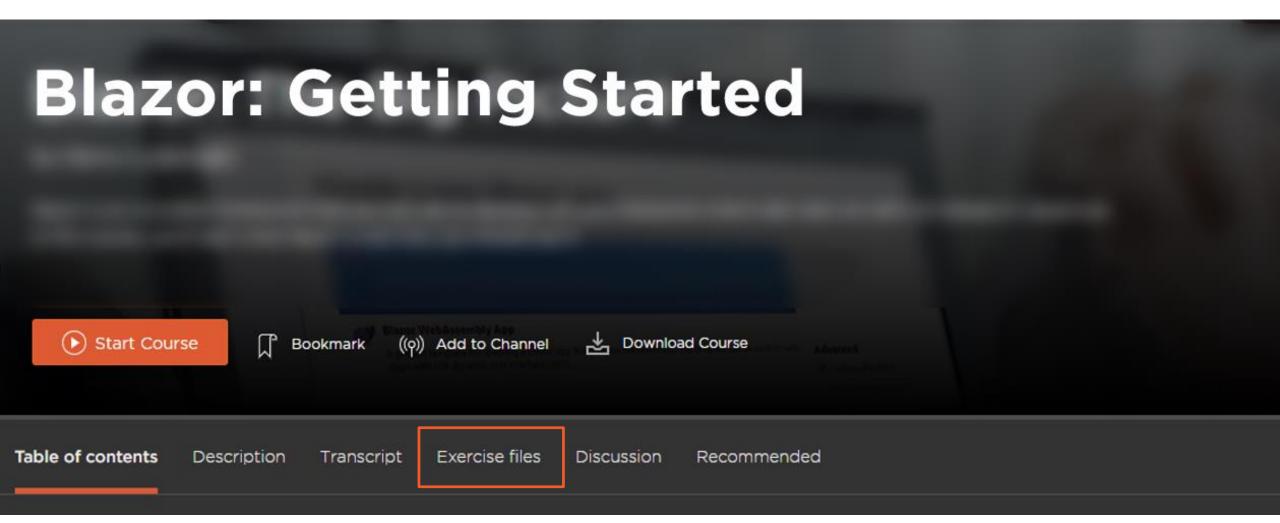

- List of employees
- Detail page
- Add new employee
- Navigation

Taking a look at the finished application

Download the Course Files

Hello Blazor

Blazor is a framework to build interactive web Uls using C# and HTML.

Hello Blazor

Based on WebAssembly or run on server

No plugin, based on web standards

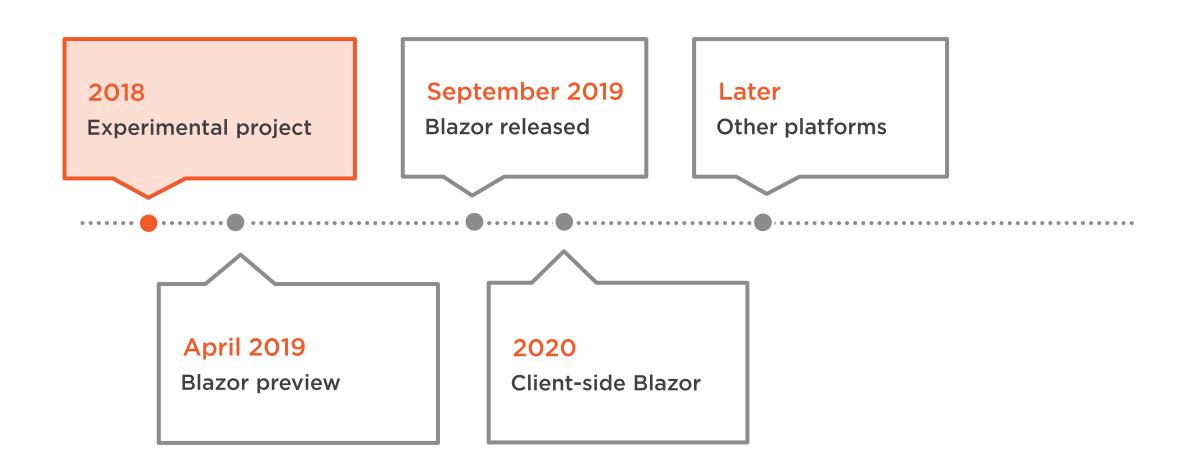

Integrate with JavaScript

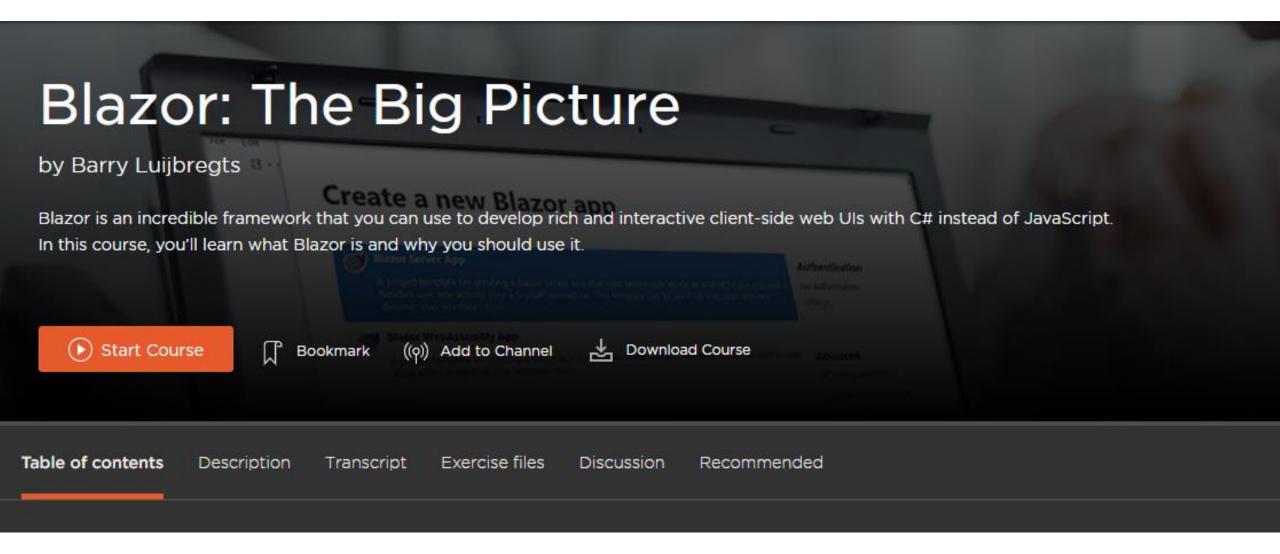

Leverage your C# skills to build interactive web applications.

Blazor Roadmap

https://www.pluralsight.com/library/courses/blazor-big-picture

The Different Hosting Models of Blazor

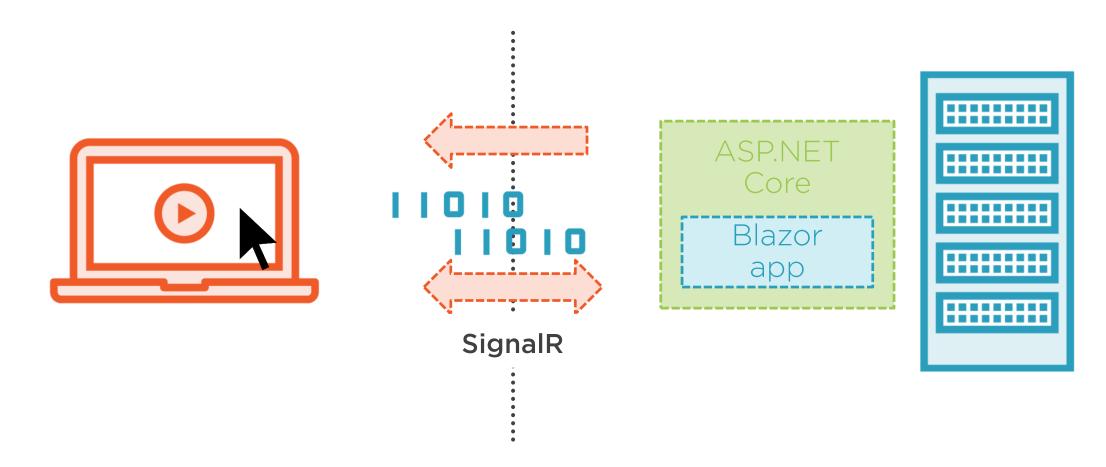

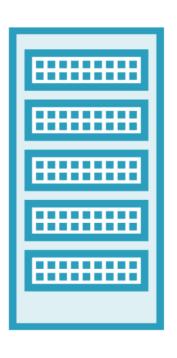

Different Flavors of Blazor

Server-side Client-side

Server-side Blazor

Small download

Works with all server-side APIs

Full debugging support

Blazor apps in non-supported browsers

No offline support

Network delay

Scalability, although not a big problem

Current state: released

Client-side Blazor

Runs on all modern browsers

No .NET required on server

SPA user experience

Older browsers might not be supported

Initial app download is larger

Debugging support

Current state: *preview*

We'll use server-side and convert to client-side later.

Let's now dive into Blazor code!

Understanding File → New Project

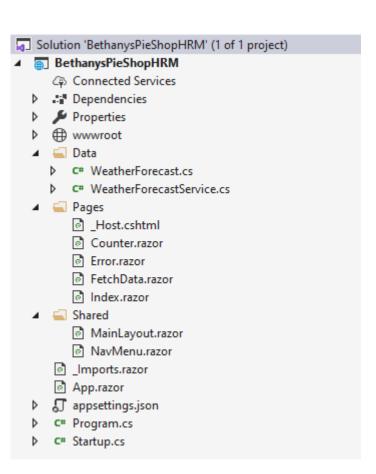

New Project

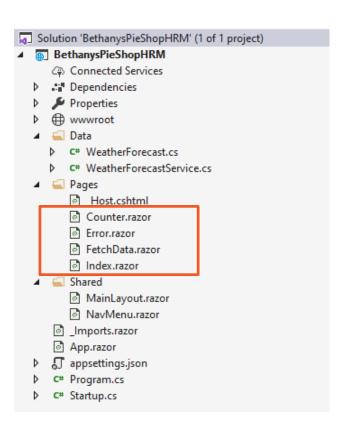

C# and .razor files

Structure similar to ASP.NET Core project

- Program
- Startup
- Similar methods

*.razor files

Components are building blocks

Name must start with uppercase

Class generated upon compilation

Looking at a the First Component

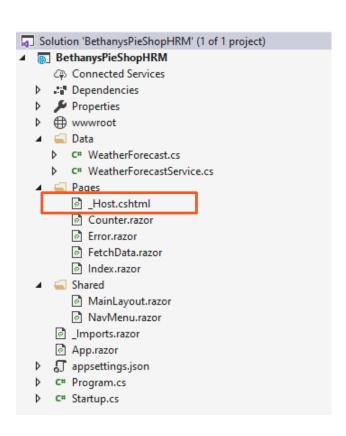

```
@page "/counter"
<h1>Counter</h1>
Current count: @currentCount
<button class="btn btn-primary" @onclick="IncrementCount">Click me</button>
@code {
   int currentCount = 0;
   void IncrementCount()
       currentCount++;
```

```
@page "/"
<h1>Hello, world!</h1>
Welcome to your new app.
<Counter />
```

Using a Component

Host for server-side Blazor app
Razor page
Configured in Startup class

Creating a new project

Looking at the created files

New to ASP.NET Core? Take a look at the ASP.NET Core Learning Path!

Creating Your First Blazor App

Using Code

Mixed approach using @code

"Code behind"

Mixed Approach

```
@page "/counter"
<h1>Counter</h1>
Current count: @currentCount
<button class="btn btn-primary" @onclick="IncrementCount">Click me</button>
@code {
   int currentCount = 0;
   void IncrementCount()
       currentCount++;
```

```
public class EmployeeOverviewBase : ComponentBase
{
}
```

Code-behind Approach

@page "/employeeoverview"

@inherits EmployeeOverviewBase

Referencing the Actual Code Class

Creating your first app

Adding your own layout

Debugging a Blazor app

Summary

Blazor allows creating rich experiences in the browser using C# and HTML

Server-side and client-side (preview)

Components are a building block
